

# Zeta Function

**Definition 1.** The *zeta function*  $\zeta(z) \equiv \sum_{n=1}^{\infty} \frac{1}{n^z}$

Converges when  $\text{Re}(z) > 1$ .

$$\zeta(\bar{z}) = \overline{\zeta(z)} \tag{1}$$

## Zeta Product Formula

$$\zeta(z) = \prod_{n=1}^{\infty} \frac{1}{1 - p_n^{-z}}, \quad \text{converges when } \text{Re}(z) > 1. \tag{2}$$

## Analytic Continuation

$$\eta(z) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^z}, \quad \text{converges when } \text{Re}(z) > 0. \tag{3}$$

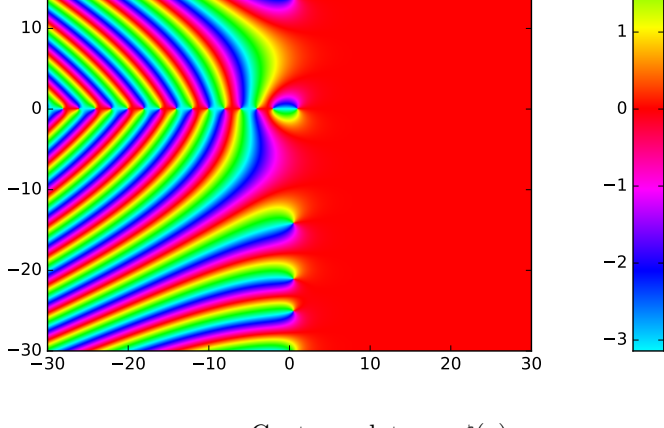

$$\zeta(z) = \frac{\eta(z)}{1 - 2^{(1-z)}} \tag{4}$$

$$\Gamma(z) = \int_0^{\infty} x^{z-1} e^{-x} dx, \quad \text{converges absolutely when } \text{Re}(z) > 0. \tag{5}$$

$$\Gamma(z+1) = z\Gamma(z) \tag{6}$$

$$\zeta(z) = 2^z \pi^{z-1} \sin\left(\frac{\pi z}{2}\right) \Gamma(1-z) \zeta(1-z) \tag{7}$$

$$\zeta(1-z) = \frac{2}{(2\pi)^z} \cos\left(\frac{z\pi}{2}\right) \Gamma(z) \zeta(z) \tag{8}$$

Notes:

1. The values of  $\zeta(z)$  where  $\text{Re}(z) > 1$  are relatively static.
2. There is a single pole at  $z = 1$  and zeros where  $z = \{-2, -4, -6, -8, \dots\}$ .

## Zeta Equivalences

$$\mu(n) = \begin{cases} 1 & n \text{ square-free with an even number of prime factors} \\ -1 & n \text{ square-free with an odd number of prime factors} \\ 0 & n \text{ has a squared prime factor} \end{cases} \tag{9}$$

$$\frac{1}{\zeta(z)} = \sum_{n=1}^{\infty} \frac{\mu(n)}{n^z} \tag{10}$$

## Reimann Function

Alternative formulation:

$$R(x) = 1 + \sum_{n=1}^{\infty} \frac{(\ln x)^n}{n! \zeta(n+1)} \tag{11}$$

## Non-trivial Zeta Zeros

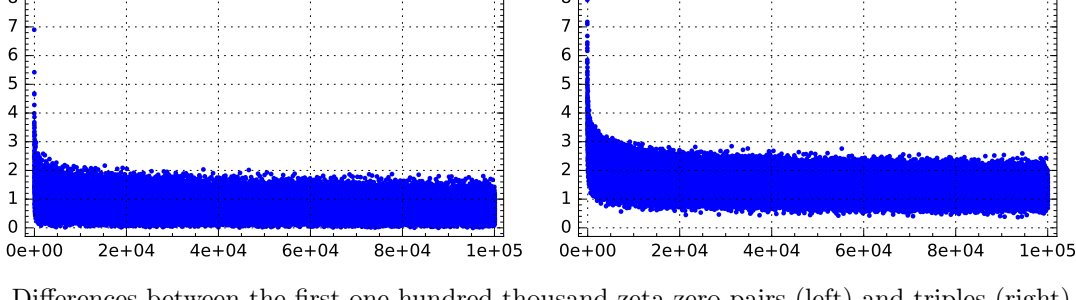

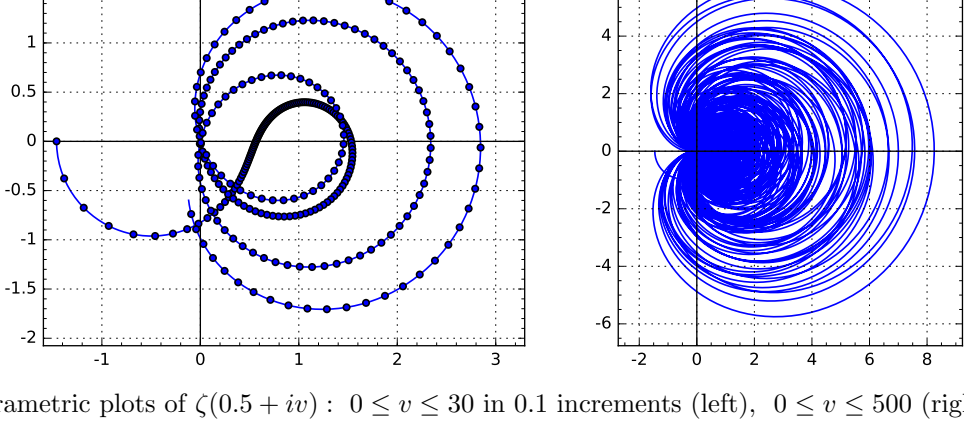

**Definition 2.** The *non-trivial zeta zeros* are all of the zeta zeros that are not on the real axis.

**Theorem 1.** The non-trivial zeta zeros are symmetric around the real axis.

**Theorem 2.** The non-trivial zeta zeros are symmetric around the line where  $\text{Re}(z) = \frac{1}{2}$ .

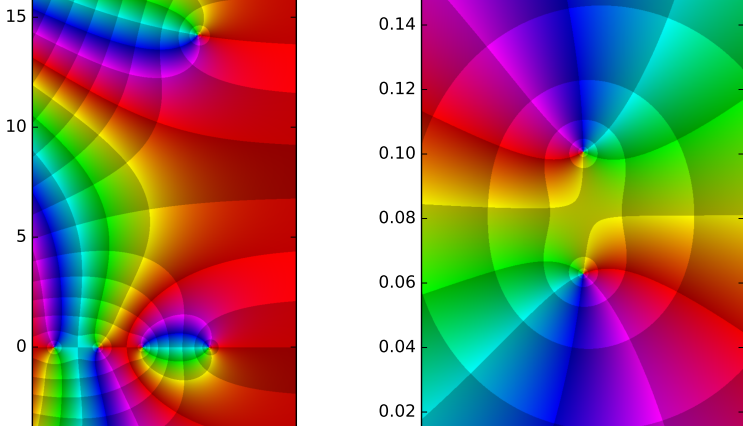

**Theorem 3.** All of the non-trivial zeta zeros are in the **critical strip**, the region where  $0 \leq \text{Re}(z) \leq 1$ .

**Conjecture 1. Reimann Hypothesis:** All of the non-trivial zeros of  $\zeta(s)$  are on the line  $\text{Re}(z) = \frac{1}{2}$ .

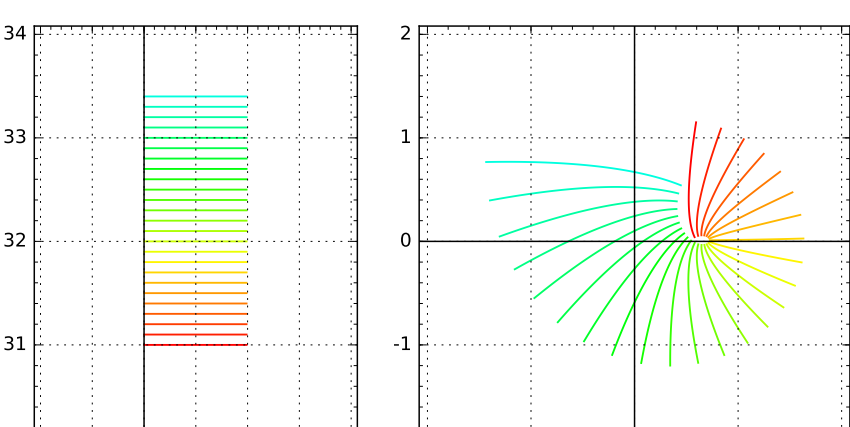

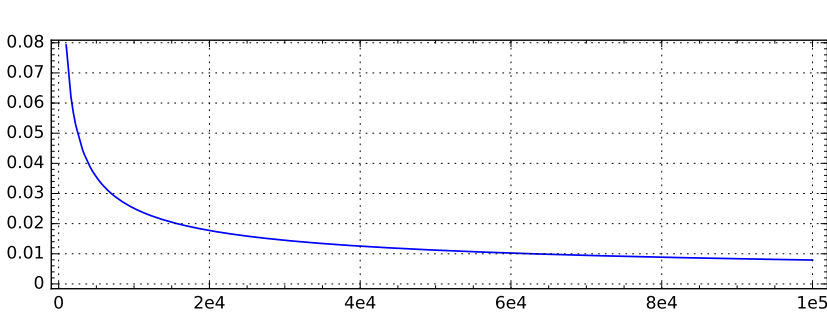

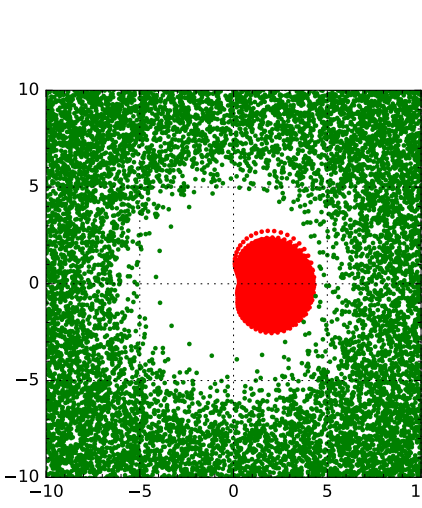

Some *close-pair* zeros:

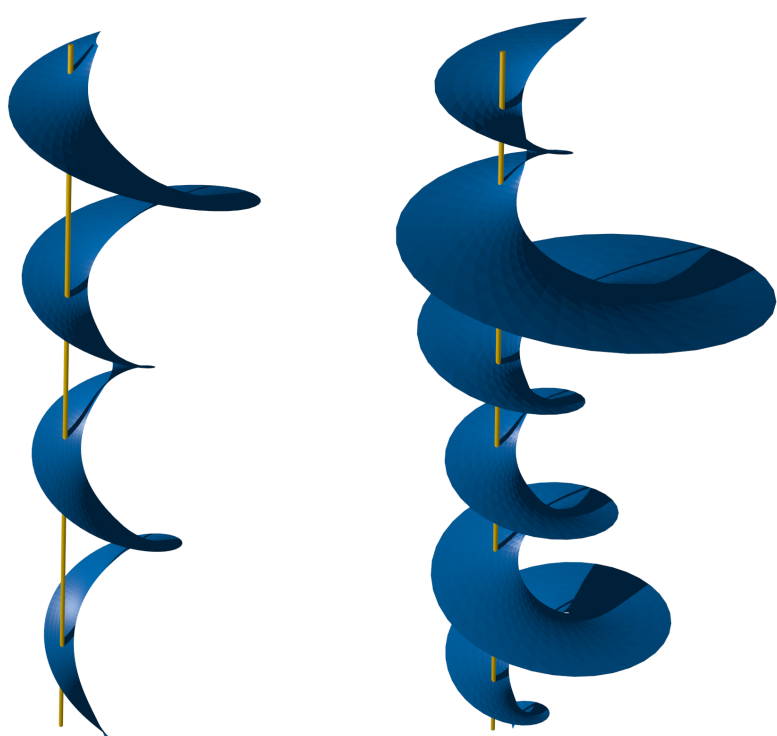

7005.062866175, 7005.100564674  
71732.901207872, 71732.915909348  
38885886.0022851203, 38885886.0023936899  
777717772.0045702406, 777717772.0047873798

The first non-trivial zero at  $\sim 14.13$  (left). A *close-pair* of non-trivial zeros at  $\sim 7005$  (right).

**Definition 3.** The zeta **critical strip spiral** is defined between constants  $c_1$  and  $c_2$  as the set of all points  $(\text{Re}(\zeta(u + iv)), \text{Im}(\zeta(u + iv)), v)$  where  $0 \leq u \leq 1$  and  $c_1 \leq v \leq c_2$ .

Notes:

1. The critical strip spiral intersects the zero line once per spiral revolution.
2. As  $v$  increases, zeros on the critical strip spiral get increasingly closer together.
3. As  $v$  increases, the critical strip spiral gets generally wider.

**Conjecture 2.** Consider the  $\mathbb{R} \rightarrow \mathbb{C}$  mapping given by  $Z(u) = \zeta(u + iv)$  where  $0 < u < 1$  and constant  $v$  is greater than one. For any  $v$ , if, for any distinct  $u_1$  and  $u_2$ ,  $Z(u_1) = Z(u_2)$  then  $|u_1 - \frac{1}{2}| \neq |u_2 - \frac{1}{2}|$ .

**Conjecture 3.** Consider the  $\mathbb{R} \rightarrow \mathbb{C}$  mapping given by  $Z(u) = \zeta(u + iv)$  where  $0 < u < 1$  and constant  $v$  is greater than one. For any  $v$ , if, for any distinct  $u_1$  and  $u_2$ ,  $Z(u_1) = Z(u_2)$  then  $|Z(1) - Z(u_1)| < |Z(1)|$  and thus neither  $Z(u_1)$  nor  $Z(u_2)$  is equal to zero.
